

# MarineGEO CPOP Data Viz

July, 2018

# Serverless CPOP data visualization

- Cron (task scheduler – windows?)
- csv files available via a url (dropbox public file)
- github pages ([marinegeo.github.io](https://marinegeo.github.io))
- D3 (javascript library)

'[https://dl.dropboxusercontent.com/s/li1ciysypwc44t2/random\\_dice\\_generator.csv?dl=0](https://dl.dropboxusercontent.com/s/li1ciysypwc44t2/random_dice_generator.csv?dl=0)'

# Demo time

- Python script that simulates rolling two dice
- After each set of rolls,
  - appends results to a csv file
  - sleeps for 2 seconds between rolls
- CSV file is shared on dropbox public URL
- Website - D3 pulls in csv file on page load
  - table
  - plots

Start rolling dice..... ``python random/random_dice.py``

<https://marinegeo.github.io/cpop-viz-demo/>

# Water Quality Visualizations

- SERC
  - 2017-03-11 -> 2017-03-31
  - ~ 20 days (5k rows)
  - Data from 2017\_Water\_Quality\_RAW\_SERC.csv
- slider example
- multi-params example
- Note: sourcing csv file on github not dropbox

# Issues

- LF vs CRLF line endings
  - line feed (unix) vs carriage return (windows) to separate rows
- Variable names with spaces (not sure about dashes)
  - Unable to use javascript dot notation
- Null data values
  - currently null data is: NA
    - need to figure out if D3 has a recommend format or
    - possibly catch exceptions
